

Intro

Hello and thank you for bought my asset, i will describe all aspect of asset below, but if you have any questions, please contract me via email liyabohnat@gmail.com

Asset Describe

This asset contain modular part of Skyscrapers and pre-assembled Skyscrapers from those modules that you can examine by your own or drag and drop ready to use assets.

Although this pack of modules was designed for Background Skyscrapers buildings, it have well good texture and mesh quality to place those assets right next to the player camera if your game uses a third person camera.

Also the whole scene uses a few Atlas textures, one main 8k for Buildings and second for Modular background roads with fake shader of cars that hopefully i can improve in future...

Folder [Prefabs] - Contain modules , which you can use to assemble your own skyscraper. Each of the asset names have their own usage rules.

- PartA - Windows.
- PartB - Solid walls and surfaces.
- PartC - Columns and pillars along with fence rails.
- PartD - Props and Furniture to decorate roofs.

Folder [PreCombined_Buildings] - Contain already assembled models and fake distance parts.

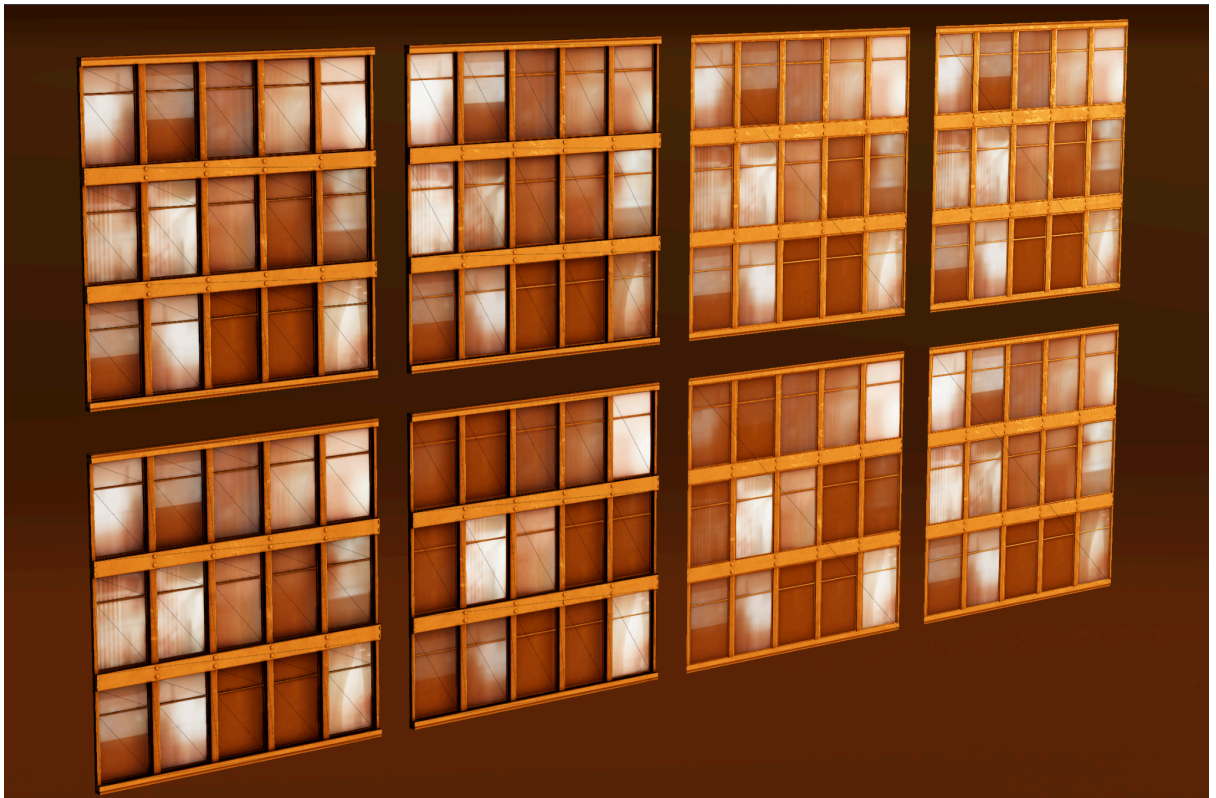

- LN3D_Modular_Skyscraper_Vol01_PartCC_Back000...011 - Primitive cubes with textures that you can place on edge of the map.
- Modular_Skyscraper_Vol01_PreCombined_000...019 - Ready to use Skyscrapers made of modules, you can use them directly in your scene or examine how modules was utilized to build those prefabs.

If you are on HDRP - you can open a "Modular_Skyscraper_Vol01_HDRP" scene where are i did build a huge city to showcase my asset benchmark .

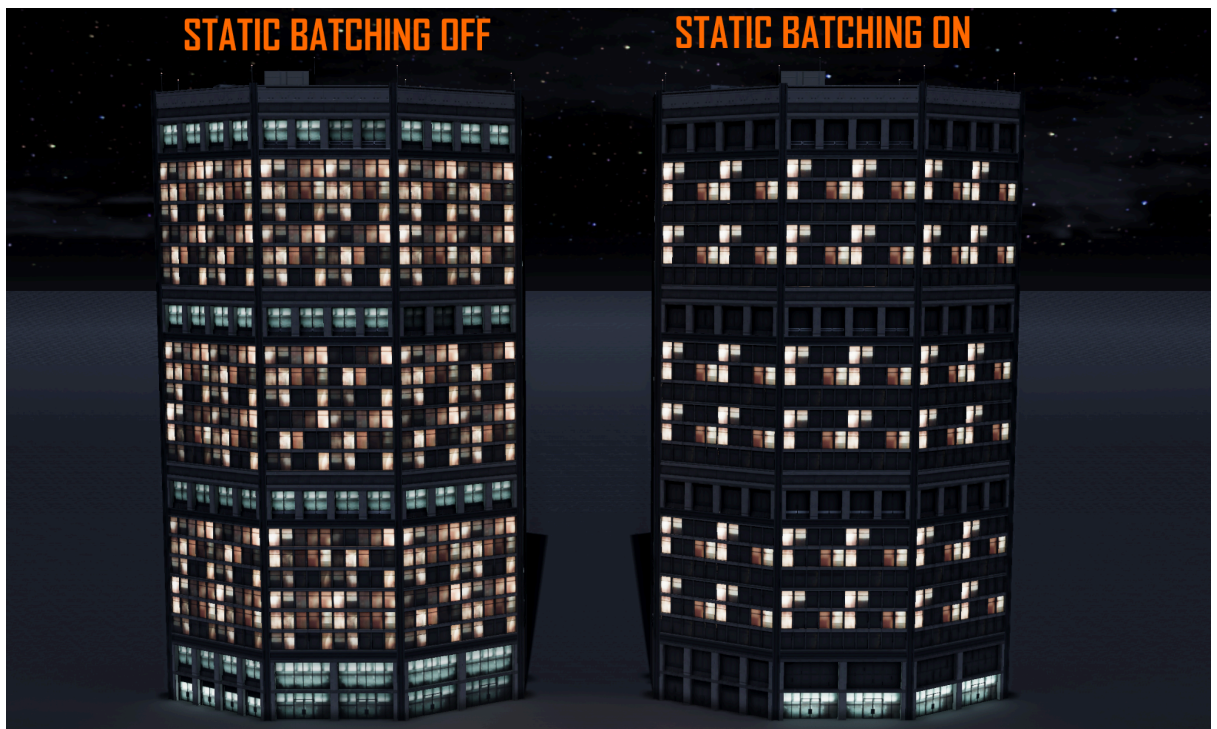

Asset Optimisation Guide

- Each Asset have 4 levels of LOD. LoD0,LoD1,LoD2,LoD3 . If you want to use building for background only purpose, then i do recommend you remove LoD0 and

LoD1 from prefabs and keep only LoD2 and LoD3 to save compute performance.

- Static Batching conflict with window shader. If you want to have a amazing night scene, i do recommend you to use my shader that already assigned to all assets. This shader randomize glow in buildings based on position. If you are active static batching, then all object will be combined under 0,0,0 coordinates and windows glow will look very repetitive.

- Draw Call optimization - you can use 3rd Party asset from Unity Asset Store to combine all parts in one single building to optimize drawcalls amount. But in order to

keep window glow randomized, you will need to modify the shader in a way to make use of RGB Vertex Color and assign random Vertex Color to the plane. Or import a single one FBX file to any 3D Software like Blender or Maya and assemble your own buildings in those software. You can contact with me, so we can figure out some solutions for your needs.

- Texture resolution and compress size. Due Skyscraper model use a one big Atlas texture with resolution of 8192x8192 pixels, if you wish to use my asset as a background buildings only or for mobile games, i do recommend you decrease texture resolution 2x or 4x time to 4096x4096 or 2048x2048 pixels. That will reduce a lot of memory usage.
- To snap modules to each other, hold button [V] and hover your mouse over the corner of the model, then hold [LMB] and then move to the corner of the model that you want to snap to.
- If you want to bring more colors to buildings, its easy! Because of whole set does use single Atlas Albedo texture, just drag and drop a “LN3D_Modular_Skyscraper_Vol01_TexA” to any 2D Graphic Software and change colors. To avoid painting of colors on windows, you can take Alpha channel of texture “LN3D_Modular_Skyscraper_Vol01_TexHDRPM”, select white color and invert selection to use it as a mask.

Its my first 3D asset in Unity Asset store , please share your feedback with me and leave a review on Asset Store to improve current and further 3D Assets.

Best wishes,
Liya
